Simply put, an object oriented database, or OODBMS (Object Oriented Database Management System), is a database that can store objects. When queried, these databases return the objects in their entirety, which means a returned object's attributes and methods are as usable as they were before the object was ever stored in the database. There are a variety of OODMBS platforms available to the public, as well as a great number of APIs and query languages to use with them. This is because ...
