Weakly interacting massive particles (WIMPs) are hypothetical particles that are thought to constitute dark matter. There exists no clear definition of a WIMP, but broadly, a WIMP is a new elementary particle which interacts via gravity and any other force (or forces), potentially not part of the standard model itself, which is as weak as or weaker than the weak nuclear force, but also non-vanishing in its strength.

The main advantage of particle beam weapons is they have penetration that make lasers look like throwing a handfull of thistledown. The main drawbacks of particle beam weapons is they are power hogs, they are difficult to reduced to pistol size, and Terra's atmosphere will scatter enough of the beam to give the firer a lethal dose of radiation.

Swarm-based algorithms emerged as a powerful family of optimization techniques, inspired by the collective behavior of social animals. In particle swarm optimization (PSO) the set of candidate solutions to the optimization problem is defined as a swarm of particles which may flow through the parameter space defining trajectories which are driven by their own and neighbors' best performances.

Analytical centrifugation (AC) is a powerful technique for the measurement of particle size distributions. This study evaluates its performance for the grouping of particulate materials according to the European

Commission's recommendation on the definition of a nanomaterial, which bases on the number-weighted median diameter.
